1. Background of Convolutional Neural Networks

Case Study: LeNet-5

[LeCun et al., 1998]

Conv filters were 5×5 , applied at stride 1

Subsampling (Pooling) layers were 2×2 applied at stride 2
i.e. architecture is [CONV-POOL-CONV-POOL-CONV-FC]

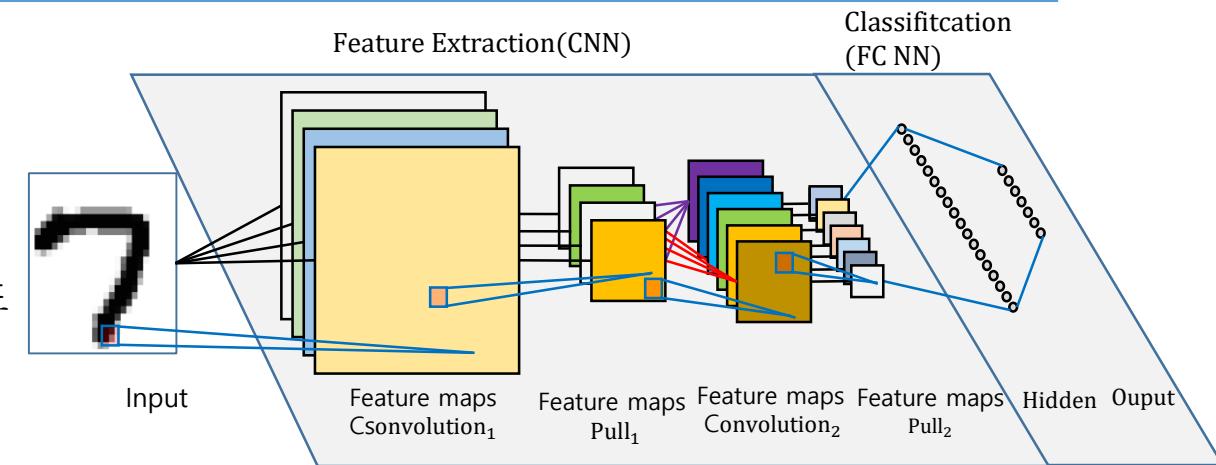

2. CNN, Convolution Neural Network

- 개요

- 전연결신경망(FC NN, Fully Connected Neural Network)을 이용한 이미지 분류의 경우 3차원 이미지를 1차원으로 평면화 하여야 한다. 이미지 공간 정보 유실로 인한 정보 부족으로 인공 신경망이 특징을 추출 및 학습이 비효율적이고 정확도를 높이는데 한계가 있습니다. 이미지의 공간 정보를 유지한 상태로 학습이 가능한 모델이 바로 CNN(Convolutional Neural Network)입니다.

- FC NN에 대한 CNN의 차이점

- 각 레이어의 입출력 데이터의 형상 유지
- 이미지의 공간 정보를 유지하면서 인접 이미지와의 특징을 효과적으로 인식
- 복수의 필터로 이미지의 특징 추출 및 학습
- 추출한 이미지의 특징을 모으고 강화하는 Pooling 레이어
- 필터를 공유 파라미터로 사용하기 때문에, 일반 인공 신경망과 비교하여 학습 파라미터가 매우 적음

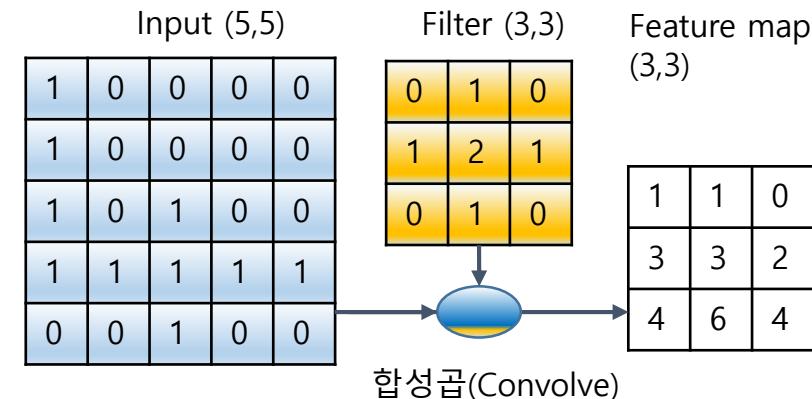

- 1. 주요 용어

- 합성곱(Convolution)
- 채널(Channel)
- 필터(Filter)
- 커널(Kernel)
- 스트라이드(Stride)
- 패딩(Padding)
- 피처맵(Feature map)
- 액티베이션 맵(Activation Map)
- 풀링 레이어(Pooling layer)

2.1 convolution

- 2.1 합성곱(Convolution)

- 합성곱은 하나의 함수와 또 다른 함수를 반전 이동한 값을 곱한 다음, 구간에 대해 적분하여 새로운 함수를 구하는 수학 연산자이다. [link]

This diagram illustrates the calculation of the first element in the feature map. It shows the input matrix and the filter being applied to it. The calculation is as follows:

$$0*0+0*1+0*0+ \\ 1*1+0*2+0*1+ \\ 1*0+0*1+1*0=1$$

The result is highlighted in red.

This diagram illustrates the calculation of the second element in the feature map. It shows the input matrix and the filter being applied to it. The calculation is as follows:

$$0*0+0*1+0*0+ \\ 0*1+0*2+0*1+ \\ 0*0+1*1+0*0=1$$

The result is highlighted in red.

This diagram illustrates the calculation of the third element in the feature map. It shows the input matrix and the filter being applied to it. The calculation is as follows:

$$1*0+0*1+0*0+ \\ 1*0+0*2+0*1+ \\ 1*0+1*1+0*0=1$$

The result is highlighted in red.

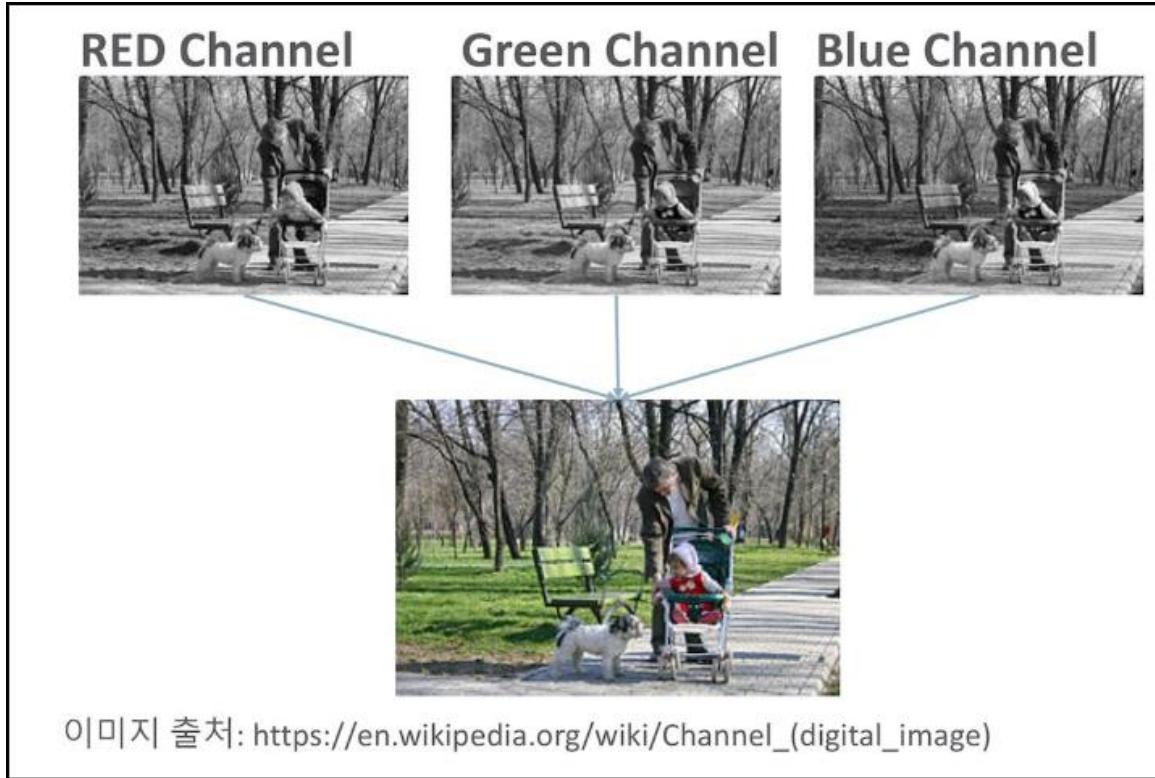

This diagram shows the final state of the feature map after the convolution process. The input matrix and filter have been processed to produce the following feature map:

1	0	0	0	0
1	0	0	0	0
1	0	1	0	0
1	1	1	1	1
0	0	1	0	0

2.2 channel

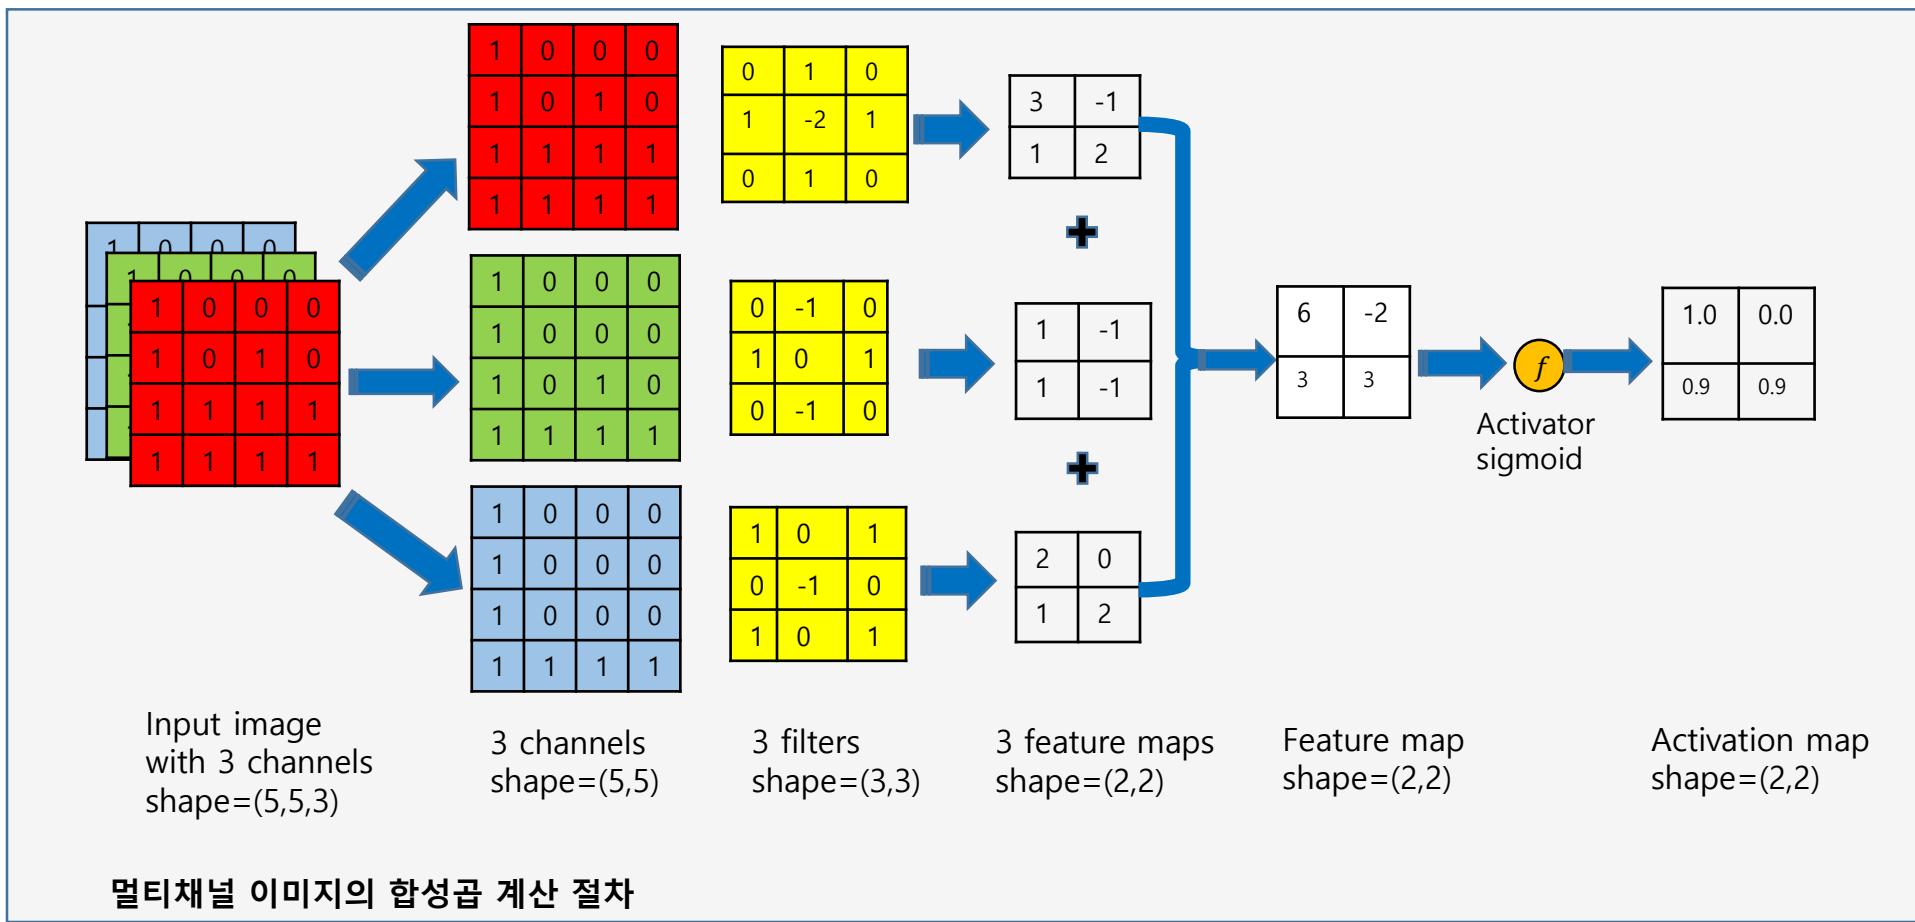

- 2.2 채널, channel

- 컬러 이미지 픽셀의 색상은 Red, Green, Blue의 크기로 합성됩니다. 따라서 컬러사의 이미지는 3장의 채널로 구성된다. 컬러 이미지의 $\text{shape}=(32,32,3)$ 흑백 이미지는 $\text{shape}=(32,32,1)$ 이 된다.

2.3 filter, kernel, stride, feature map and activation map

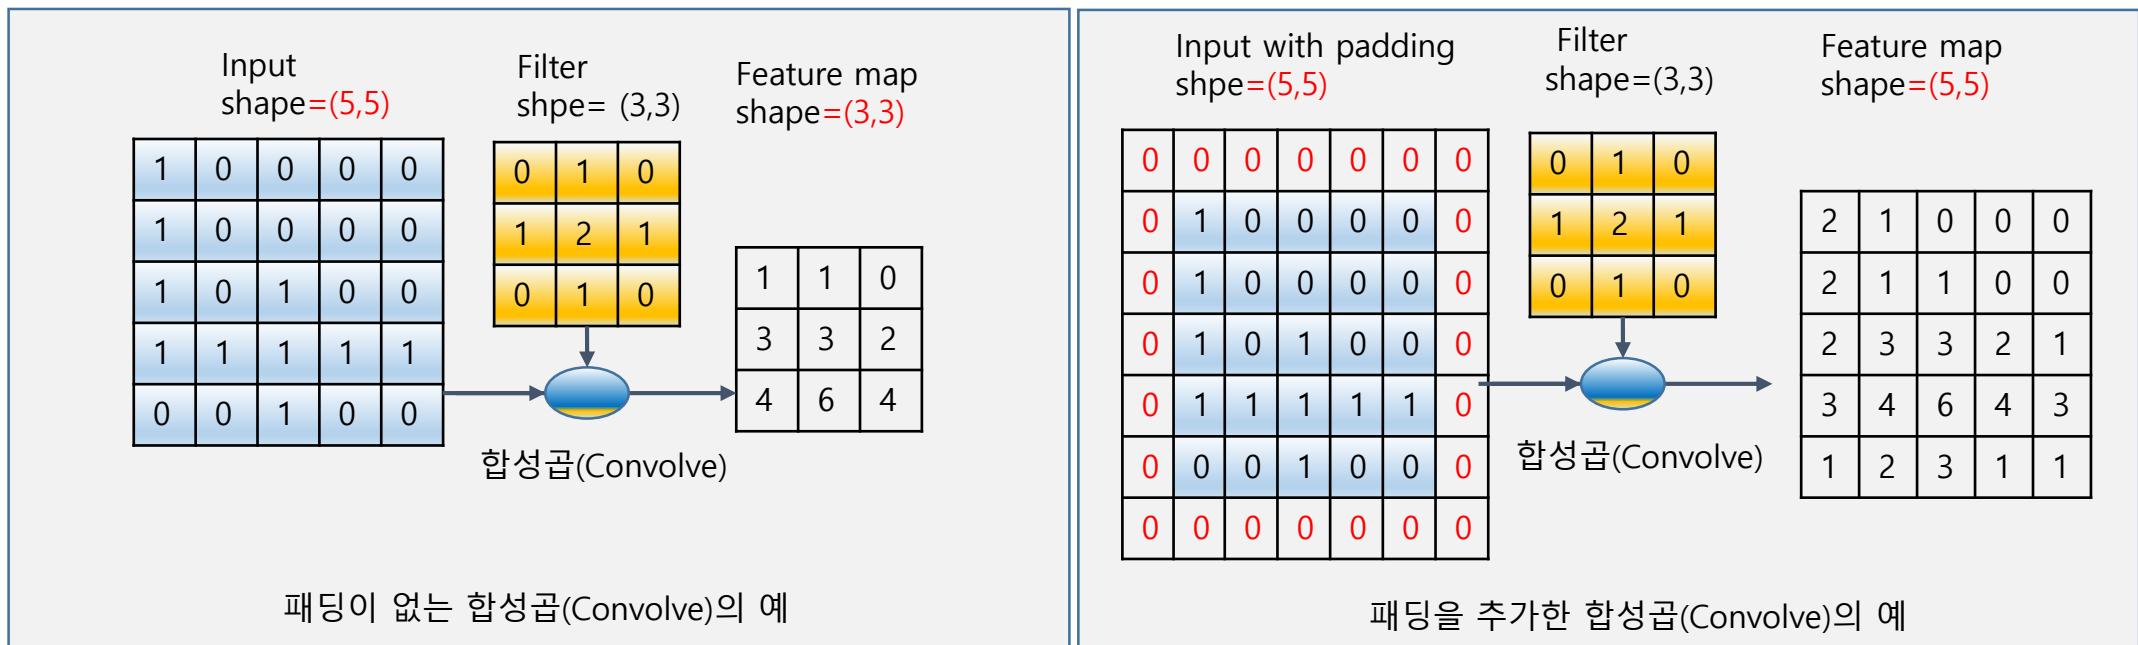

- 2.3 합성곱 : 필터, 스트라이드, 피처맵(feature map), 커널(kernel)
 - 커널 : 필터와 동일, 스트라이드는 필터의 이동 픽셀 수, 피처맵 : 합성곱의 계산결과 이미지
 - 액티베이션 맵 : 피처맵에 액티베이션을 적용한 결과

2.4 padding

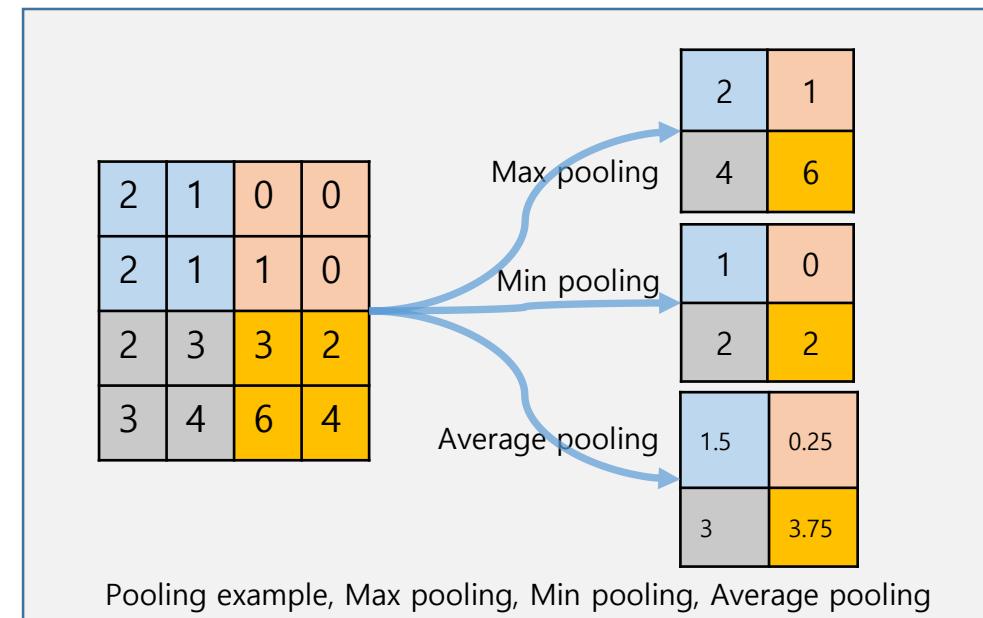

- 2.4 패딩

- 합성곱을 하면 입력에 비하여 피처맵의 사이이즈가 작아진다. 같은 크기가 되도록 입력의 가장자리에 0을 채우는 과정을 말한다.

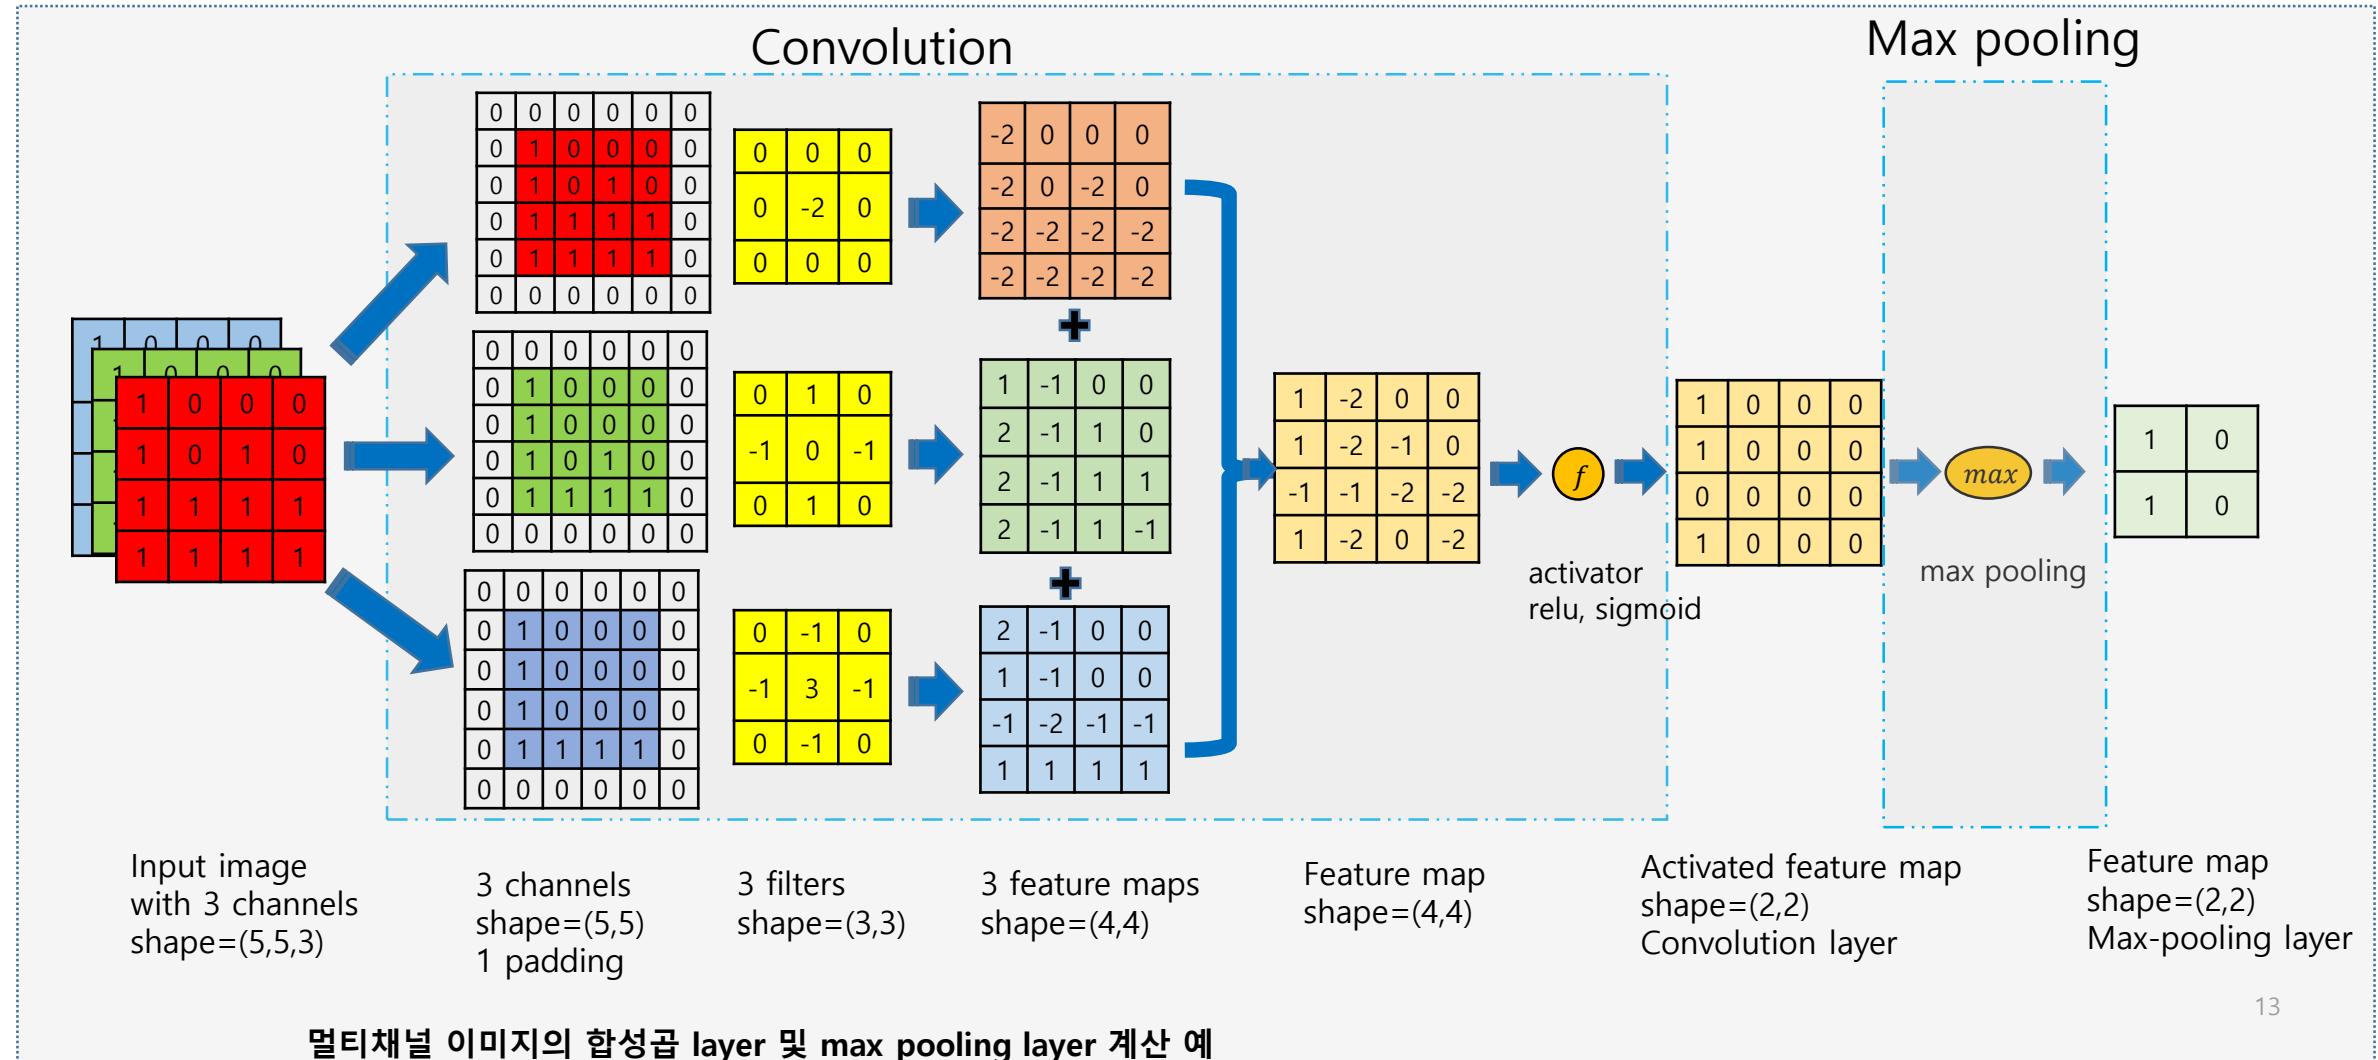

2.5 pooling layer

- 2.5 pooling layer
 - Convolution layer의 출력(activation map)의 일정 값은 강조하거나 크기를 줄이는 목적으로 사용된다. Pooling 방법은 max, min, average pooling이 있다. 일반적으로 pooling size와 stride size로 한다.
 - Pooling 특징
 - 학습대상 파라미터가 없음
 - Pooling 레이어를 통과하면 행렬의 크기 감소
 - Pooling 레이어를 통해서 채널 수 변경 없음

2.5 pooling layer

2.6 출력 레이어의 크기 계산

- 2.6 레이어의 출력 크기 계산

- 입력 데이터 높이: H
- 입력 데이터 폭: W
- 필터 높이 : FH
- 필터 폭 : FW
- Stride 크기 : S
- 패딩 사이즈 : P

- Convolution layer 출력의 크기

- $OuputHeight = oh = \frac{H+2P-FH}{S} + 1$

- $OuputWidth = ow = \frac{W+2P-FW}{S} + 1$

- Pooling layer 의 출력 크기

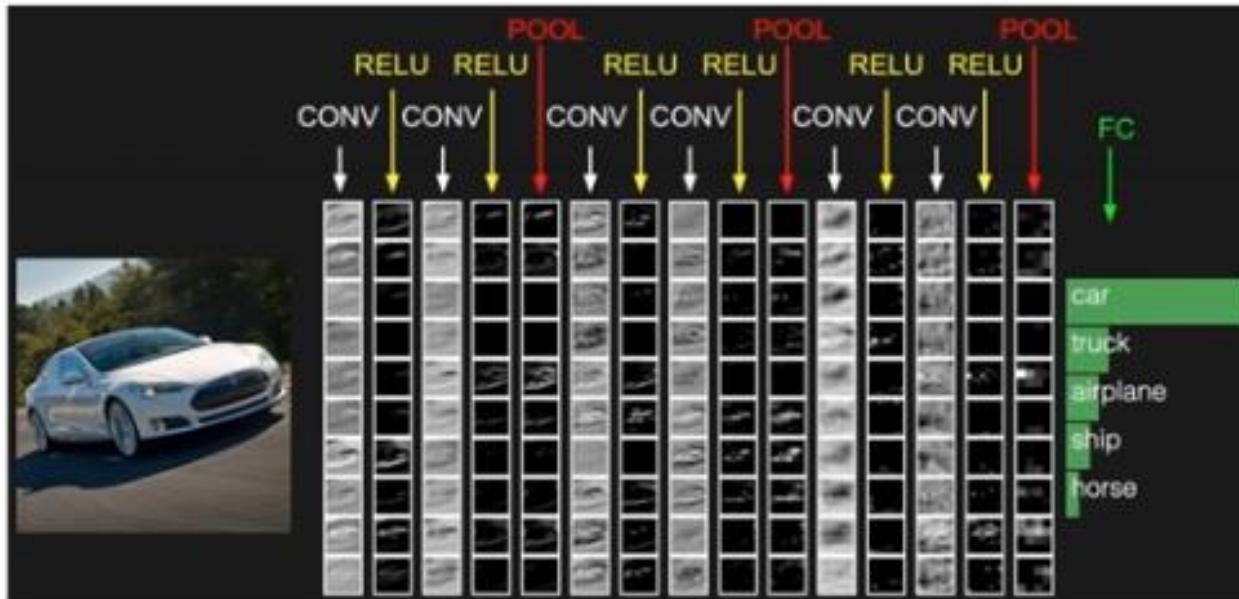

- $OuputRowSize = \frac{\text{InputRowSize}}{\text{PoolingSize}}$

- $OuputColumnSize = \frac{\text{InputColumnSize}}{\text{PoolingSize}}$

2.7 Fully Connected Layer(FC layer)

Fully Connected Layer (FC layer)

- Contains neurons that connect to the entire input volume, as in ordinary Neural Networks

3.6 AlphaGo

Case Study Bonus: DeepMind's AlphaGo

3.6 AlphaGo(cont.)

The input to the policy network is a $19 \times 19 \times 48$ image stack consisting of 48 feature planes. The first hidden layer zero pads the input into a 23×23 image, then convolves k filters of kernel size 5×5 with stride 1 with the input image and applies a rectifier nonlinearity. Each of the subsequent hidden layers 2 to 12 zero pads the respective previous hidden layer into a 21×21 image, then convolves k filters of kernel size 3×3 with stride 1, again followed by a rectifier nonlinearity. The final layer convolves 1 filter of kernel size 1×1 with stride 1, with a different bias for each position, and applies a softmax function. The match version of AlphaGo used $k = 192$ filters; Fig. 2b and Extended Data Table 3 additionally show the results of training with $k = 128, 256$ and 384 filters.

policy network:

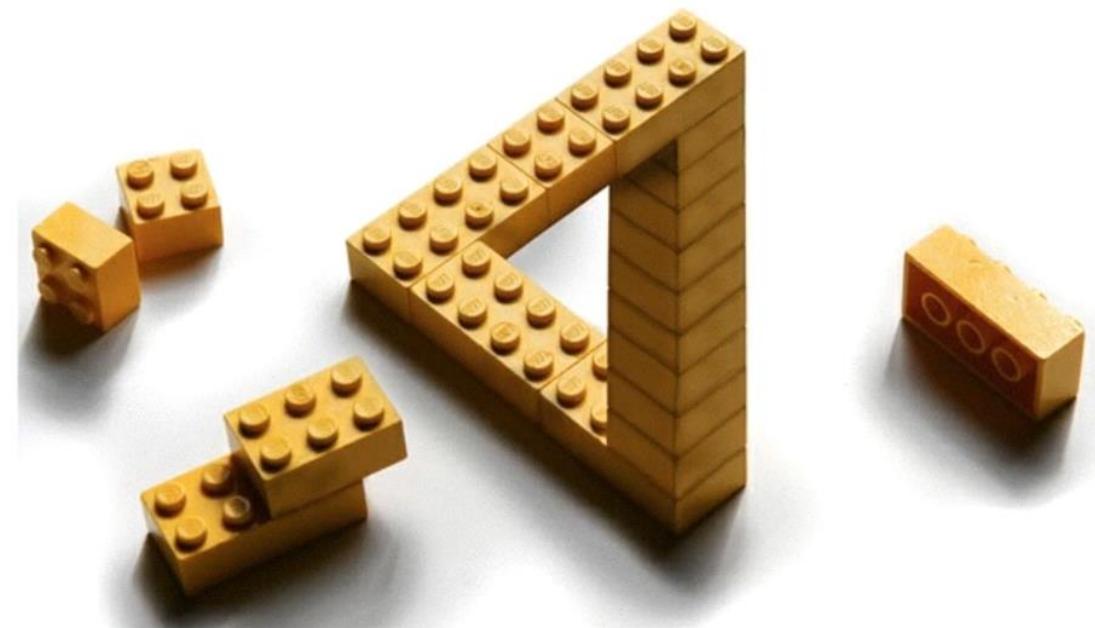

[$19 \times 19 \times 48$] Input

CONV1: 192 5×5 filters , stride 1, pad 2 => [$19 \times 19 \times 192$]

CONV2..12: 192 3×3 filters, stride 1, pad 1 => [$19 \times 19 \times 192$]

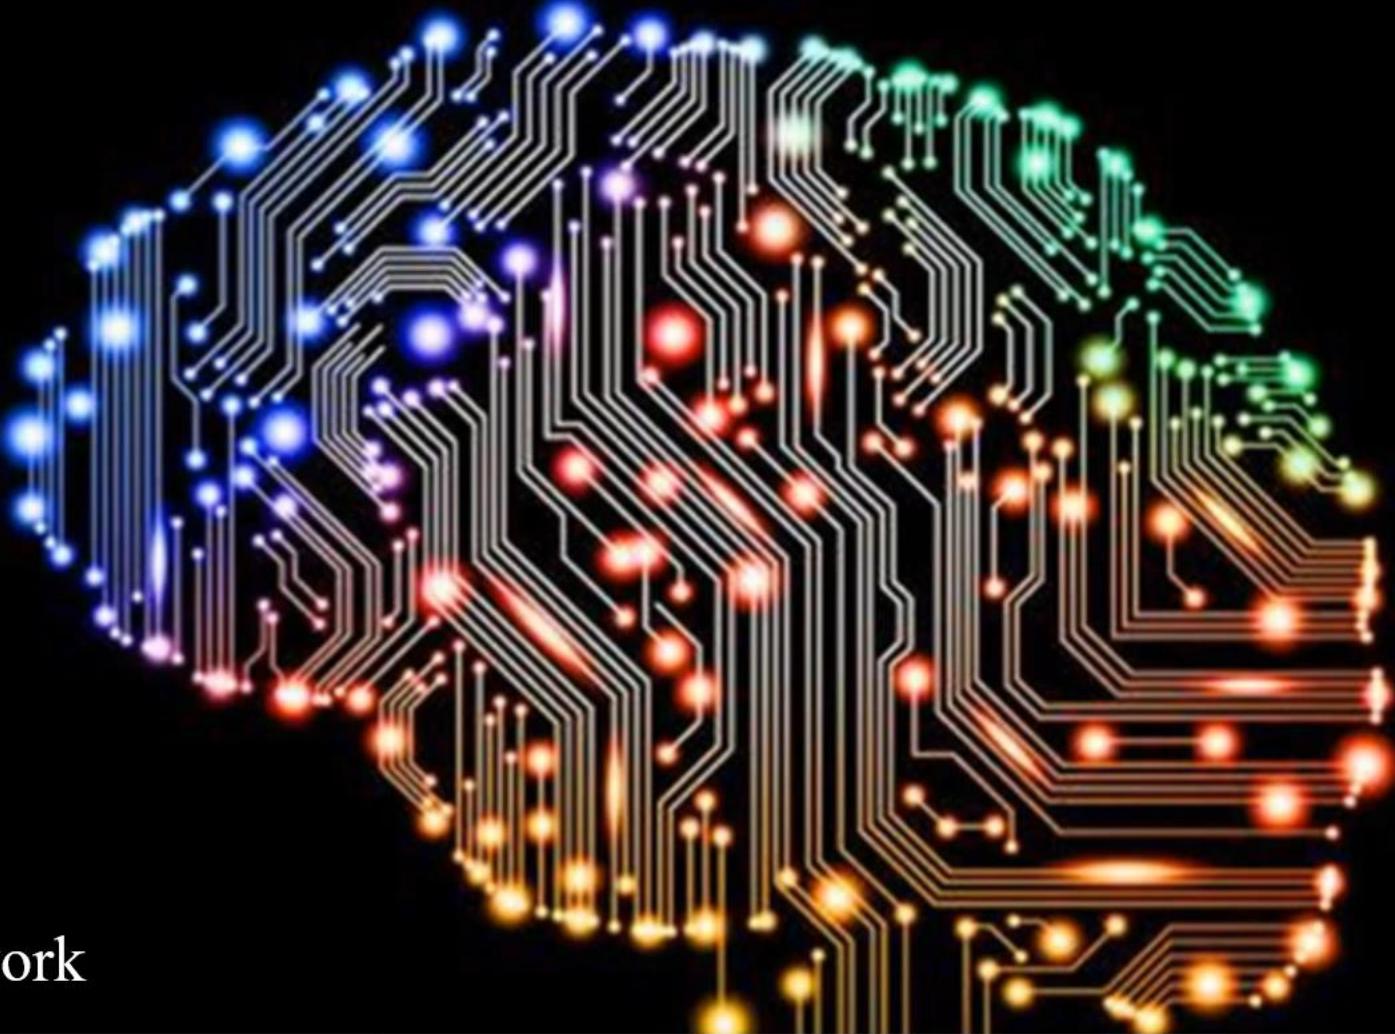

CONV: 1 1×1 filter, stride 1, pad 0 => [19×19] (*probability map of promising moves*)
